A smooth transition to bundling

with

What is Bundling?

Pending CMS regulations stipulate that an ESRD facility will be reimbursed based on a “bundle,” which is a single set fee for **all** the items provided during a dialysis treatment. The bundle will include the treatment itself and the medications and services that were previously billed separately. Compliance with the new CMS regulations becomes mandatory January 2011. ESRD facilities are required to notify CMS of their degree of transition (blend) to the new regulations by **November 1st 2010**.

How does it effect you?

- additional clinical parameters will need to be charted (hemo access, infection)
- your organization will be required to submit claims in a different format
- the new claim format will include additional clinical information which must be retrieved from the medical record
- your reimbursement will increase or decrease depending on the nature of your patient population as well as the accuracy and completeness of the medical record

How does cyberREN support bundling?

cyberREN supports bundling from both a *clinical* and *financial* perspective.

cyberREN will;

- capture the required demographic information including, BSA and BMI
- automatically capture & code the mode of hemodialysis access
- capture and maintain a current problem list as well as co-morbid conditions list, which are ICD-9 coded (ICD-10 also already supported)
- include these clinical attributes in subsequent financial processing

Business Analysis: cyberREN will enable organizations to run simulations that will predict revenues according to the different blending options, allowing the choice of the blend that will generate the most revenue.

CMS Compliance: cyberREN assures that your claims will meet all the requirements imposed by the new CMS regulations.

Revenue Optimization: no transcription, no missed charges, timely claim generation, timely payments.

Avoid Regulatory Audit Stress: your medical record will always be consistent with your financial record.
